## General App flow

Git flow Branching Strategy

Git workflow designed to help better organize code
by following a strict branching strategy

We want our branches base on project features and releases

Officially you can setup a repo following these guidlines
using the git-flow command line tool
- Or just create the branches yourself

Typical Branches/Work flow
- Main branch
  - production build of the project
- Develop/ment
  - hold code for your next release
- feature
  - individual features being pushed into
    the develop branch
- Hotfix
  - Emergency fixes

| → Major Reales. | → update. | → minor fixes

Merging and Merge Conflicts

It is NOT best practice to merge your code automatically, rather you should use poll requests

When we make a poll request it signifies the feature you are working is complete and ready to be merged
- Someone will review your code, and merge

To create a poll request go to github
→ Pollrequests tab
→ Click create poll request
→ choose which branch you want to merge into
→ choose which branch you are merging
→ Submit
